BACKGROUND

- Agonist CD40 mAbs can mediate antitumor immunity[1]
  - Enhance tumor antigen presentation by dendritic cells (DCs)
  - Activate tumoricidal macrophages
  - Direct growth inhibition/killing of CD40-expressing tumor cells
- CDX-1140: fully human IgG2 agonist anti-CD40 mAb[2]
  - Activates DCs and B cells in an FcR-independent manner
  - Potent antitumor activity against CD40-expressing cancer cells
  - Unique and linear dose-dependent *in vitro* and *in vivo* activity; should allow for significant tumor and tissue penetration without dose limiting-toxicities (DLT) from systemic CD40 activation
- CDX-301 (rFLT3L): DC growth factor[3, 4]
  - Increases multiple DC subsets in blood and tissues
  - May mediate antitumor immunity through promotion of CD141+ DCs, tumor antigen uptake and cross presentation to CD8+ T cells[5]
- CD40 ligation and FLT3L are synergistic in murine tumor models[6, 7]

Study Design

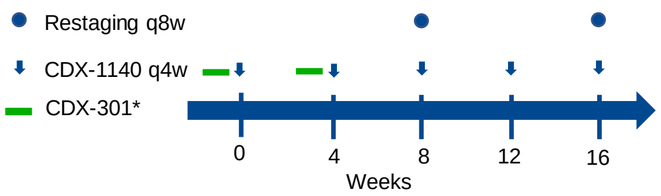
- Phase 1 dose-escalation and cohort expansion study evaluating safety, PK, PD, and preliminary clinical activity of CDX-1140 as monotherapy and in combination with CDX-301
- Patients with advanced solid tumors who have exhausted standard-of-care treatment options, with measurable disease and documented progression

CDX-1140 monotherapy

- Dose escalation from 0.01 to 3.0 mg/kg IV q4w
  - 1+5 design for 1st two dose levels, then 3+3 design thereafter
- DLT evaluation period: 28 days after the 1st infusion

CDX-1140 in combination with CDX-301

- CDX-1140 dose escalation from 0.09 to 3.0 mg/kg IV q4w
  - 3+3 design for all cohorts
- CDX-301 (75 μg/kg sc) x 5 days prior to 1st two CDX-1140 doses
- DLT evaluation period: 35 days after the 1st CDX-1140 infusion (i.e., 7 days after the 2nd infusion)



*CDX-301 is administered for patients in the combination portion only

Dose-Escalation Status

Monotherapy (n=13)

- 0.01 mg/kg (n=2) Pancreatic, CRC
- 0.03 mg/kg (n=1) Bladder
- 0.09 mg/kg (n=3) HNSCC, Ovarian, Cholangiocarcinoma
- 0.18 mg/kg (n=7) Pancreatic, CRC, Gastric, RCC (x2), HNSCC, Ovarian — One DLT (pneumonitis & hypoxia) DLT evaluation complete; dose-escalation proceeding

Combination (n=4)

- 0.09 mg/kg (n=4) Pancreatic, CRC, Mesothelioma, NSCLC — Observation for DLT ongoing

Abbreviations: CRC, colorectal cancer; RCC, renal cell cancer; NSCLC, non-small cell lung cancer; HNSCC, head and neck squamous cell carcinoma; WBC, white blood count; ALT, alanine aminotransferase; AST, aspartate aminotransferase; PK, pharmacokinetic; PD, pharmacodynamic; SD, standard deviation; DLBCL, diffuse large B-cell lymphoma

ClinicalTrials.gov: NCT03329950

INITIAL RESULTS

Baseline Patient Characteristics

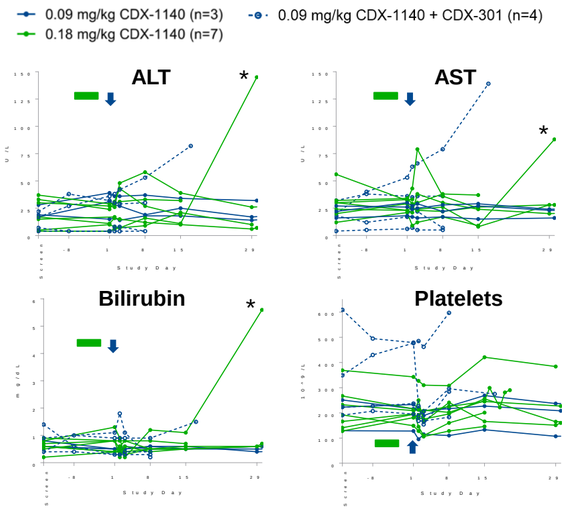
	Monotherapy (n=13)	Combination (n=4)
Age, years (median, [range])	64.5 (44-81)	60.5 (53-83)
Male	9 (69%)	2 (50%)
ECOG		
0	5 (38%)	0
1	8 (62%)	4 (100%)
No. prior treatment regimens (mean [range])	4 (1-9)	3 (2-5)
Prior checkpoint inhibitor	7 (54%)	1 (25%)
Prior chemotherapy	12 (92%)	4 (100%)

Data shown as n (%) unless otherwise specified.

Toxicity

- 1 DLT (CDX-1140 monotherapy, 0.18 mg/kg): grade 3 pneumonitis and hypoxia. Patient subsequently died due to Enterobacter pneumonia/bacteremia deemed unrelated to CDX-1140
- No other treatment related SAEs or treatment related deaths
- All additional treatment-related toxicity grade 1-2: nausea, fatigue, anorexia, arthralgia, myalgia, fever, chills, generalized muscle weakness, hot flash, dizziness

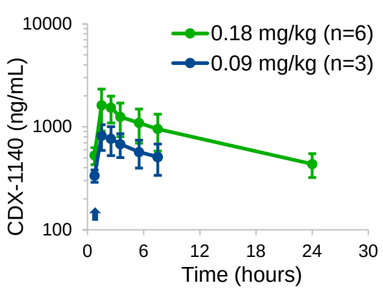
No Significant Drug-related Changes in Liver Function Tests or Platelets



* Patient with common bile duct obstruction unrelated to CDX-1140.

Expected dose-dependent, transient decrease in lymphocytes also observed (see flow cytometry)

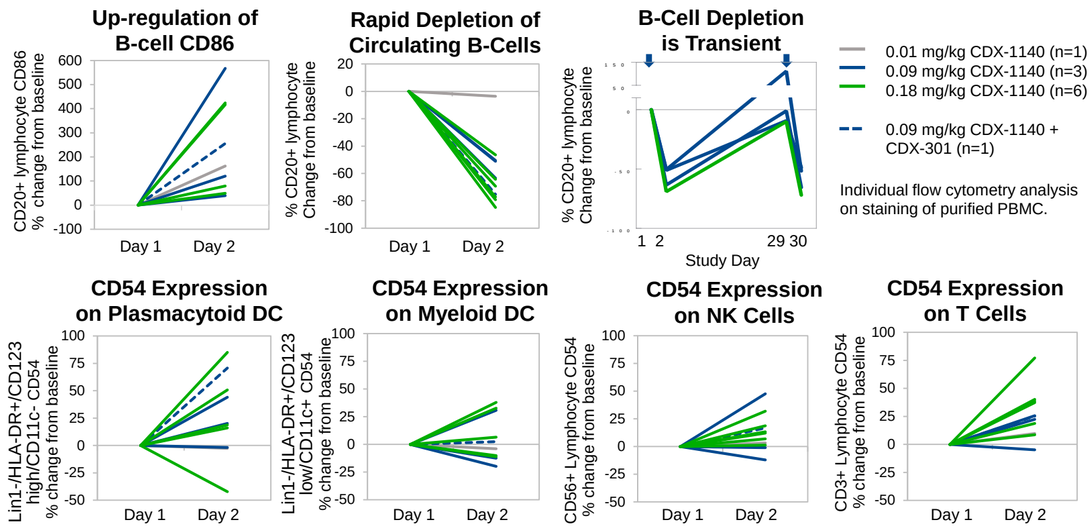
Pharmacokinetic Analysis



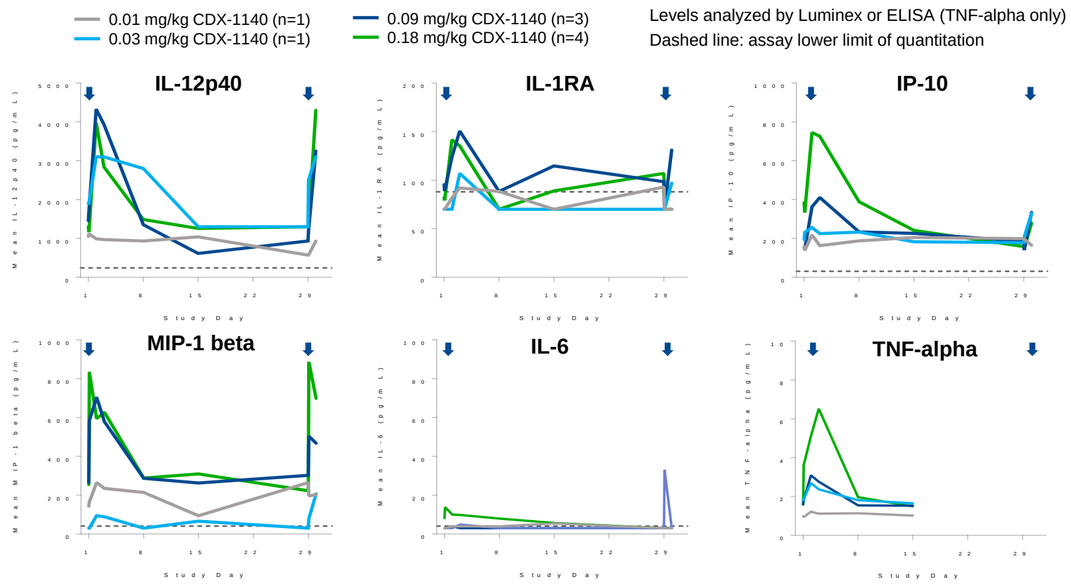
- CDX-1140 is quantifiable at doses ≥ 0.09 mg/kg
- Exposure appears dose proportional

Mean (± SD) serum levels of CDX-1140 (monotherapy) following first 90 minute infusion

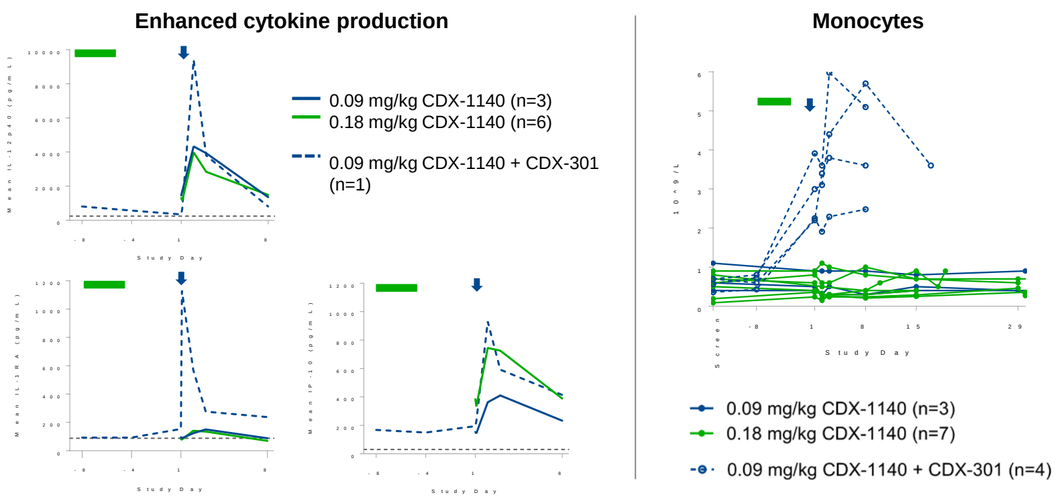
Activation of Peripheral Blood Immune Cells



Dose-Dependent Induction of Pro-Inflammatory Cytokines and Chemokines



Preliminary Evidence of Increased Immune Activity with Combination of CDX-1140 and CDX-301



CONCLUSIONS AND FUTURE DIRECTIONS

- CDX-1140 monotherapy to date (at doses ≤ 0.18 mg/kg):
  - Well-tolerated with minimal drug-related toxicity
  - Transient, dose-dependent pharmacodynamic effects
  - Results consistent with CD40-mediated immune cell activation and the hypothesis that CDX-1140 may achieve dose levels optimal for systemic exposure
- CDX-1140 (at 0.09 mg/kg) in combination with CDX-301:
  - No safety concerns to date with initial patients
  - Preliminary evidence of enhanced immune activation
- Further dose-escalation will define recommended dose for evaluation of clinical activity in expansion cohorts
- Study amended to include non-Hodgkin's lymphoma (NHL) in monotherapy portion
  - CDX-1140 has direct killing effect on CD40-expressing NHL cells[2]
- Future opportunities include combinations with varlilumab (in lymphomas), radiation therapy, and/or checkpoint blockade
  - Several B cell lymphomas including DLBCL and follicular lymphoma express CD40 and CD27
  - Varlilumab is a potent anti-CD27 agonist
  - CDX-1140 synergizes with varlilumab in NHL models[8]
